

## **CHALLENGE #1: GOAL**

Objective: Prepare a one-page documentation containing your goals and plan for your website based on your learning in w3school.

Base on my learnings on w3school, I have now a plan to make a website of the delicacies and eating places of my own municipality (M'lang) that contain a design that meet the expectation of users. On this goal, I will use HTML, CSS and Java Script to meet my objectives.

It will contain 6 sections the Header, Home, Delicacies, Eating Places, About Us and the Footer. Header section will contain the navigation buttons. Home section will contain the background image of our Municipal Hall. Delicacies section will contain various local delicacies of M'lang, each with an image, a name, and a description. Eating Places section will contain lists different eating places in M'lang with images and brief descriptions. About Us section will provide an overview of the purpose and mission of the website and the Footer section will contain the copyright details.

I will have a CSS stylesheet that styles various sections of a website, including the Header, Home, Delicacies, Eating Places, About Us, and the Footer. The adjustments for different screen sizes to ensure responsiveness and proper layout adjustments for various devices.

I will learn more about Java Script to implement a responsive navigation menu and a scroll-triggered header background color change.
